New chimeric proteins containing human growth hormone fragment, used

~

```
This sequence represents a chimeric protein, which contains an N-terminal fragment of human growth hormone (hCH) of the sequence given in AAY42865, a cleavable petide linker (AAY42857), and a human insulin precursor comprisaing it to fold correctly. The hCH nortion of the chimeric protein acts as an intramolecular chaperone (IMC) for the chimeric protein acts as an intramolecular chaperone (IMC) for the chimeric protein to be removed after folding has taken place. Production of recombinant human insulin vith correctly linked cystoine bridges with fewer necessary procedural steps, and hence resulting in a higher protein can provide human insulin with correctly linked cystoine bridges with fewer necessary procedural steps, and hence resulting in a higher promote the folding of the fused insulin precursor, facilitate the solubility of the fusion protein and decrease the intermolecular interactions among the fusion proteins, thus allowing folding of the fusion proteins, thus allowing folding of the concentrations. The procedural steps of cyanogen bromide cleavage, oxidative sulphifolysis and related purification steps can thus be eliminated, along with the use of hydrophobic absorbent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 TPSNREETQQKSNLELLRISLLLIQSMLEPVQLGTGPRFVNQHLGGSHLVEALYLVGGER 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                            This sequence represents a chimeric protein, hGH-mini-proinsulin.

This chimeric protein contains an N-terminal fragment of human growth hormone (hGH) of the sequence given in AAV4285, a cleavable peptide linker (AAV42857), and a human insulin precursor comprising insulin A and B chains (AAY42857). The hGH portion of the chimeric protein acts as an intramolecular chaperone (IMC) for the insulin precursor, can intramolecular chaperone (IMC) for the insulin precursor, can be chained in the fold correctly. The cleavable peptide linker has a C-terminal Arg residue which enables the hGH portion of the chimeric protein to be removed after folding has taken place. Production of the combinant human insulin via an hGH-proinsulin chimeric protein can provide human insulin with correctly linked cysteine bridges with fewer necessary procedural steps, and hence resulting in a higher yield of human insulin with correctly linked cysteine bridges with fewer necessary procedural steps, and hence resulting in a higher yield of human insulin adelaction by a microoraganism host, but also promote the folding of the fused insulin precursor, facilitate the solubility of the fusion protein and decrease the intermolecular interactions among
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                          the fusion proteins, thus allowing folding of the fused insulin precursor at commercially useful high concentrations. The procedural steps of cyanogen bromide cleavage, oxidative sulphitolysis and related

Pro-insulin is produced by treating recombinant precursor protects with a mercaptan to provide 2-10 SH residues per Gys residue. In presence of a chaotropic agent and in ag. medium of pH 10-11. It reating the prod, with 3-50 g hydrophobic adsorber resin per i and desorbing the prod, with 3-50 g hydrophobic adsorber resin per i and desorbing the pro-insulin. This method produces pro-insulin and desorbing the pro-insulin. This method produces pro-insulin with correctly bonded Cys bridges. Compared with known methods in involves fewer stages (egp. no sulphitolysis or cyanogen bromide the process is quicker and gives better yields.

C sequences of insulin chain A, b and C are given in AAR68895-97.

Sequences of pro-insulin 14 are given in AAR68898-901.

(Updated on 25-MAR-2003 to correct PN field.)

The insulin produced can then be purified. This sequence is a SOD-insulin B chain-Lys-Arg-insulin A chain hybrid polypeptide and is encoded by the plasmid construct pBAST-R. Transformation of the proper E.coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant insulin prodn. by correctly folding pro-insulin hybrid polypeptide - then enzymatic cleavage of folded product, does not require sulphite protection of SH nor use of cyanogen bromide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   4.5 YSFL; 2NPLGT --- GPRPVNQHLCGSHLVEALYLVCGERGFFYT PKTRGTVEQCCTSLCSL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                 Recombinant insulin prodm. by correctly tolding pro-insulin hybrid polypeptide - then enzymatic cleavage of folded product, does not require sulphite protection of SH nor use of cyanogen bromide
                                                                                                                                                                                                                         comprises folding a hybrid polypeptide comprising proinsulin under conditions that permit correct dissulphide bond formation and subjecting that folded protein to enzymetic cleavage. The insulin produced can then be purified. This sequence is a SOD-insulin broduced can then be purified. This sequence is a SOD-insulin broduced can then be purified. This sequence is a SOD-insulin by the plasmid construct pDBAST-LAT. Transformation of the proper E.coli host cells with pDBAST-LAT results in the efficient expression of the proinsulin hybrid polypeptide. Wasful for human insulin producion, the method produces recombinant human insulin identical to the natural hormone. Hazardous and cumbersome
                                                                                                                                                                                                                                                                                                                                                                                                                                                     procedures involving cyanogen bromide and sulphitolysis to protect. SH groups are avoided since the entire hybrid polypeptide folds efficiently to the native structure even with the leader attached

                                                                                                                                                                           ó
                                                                                                                                   AAQ86425 encodes AAR71692 mating factor alpha 1-Insulin precursor ArgB13. ArgB13 comperises the B and A chains of a claimed human insulin derivative. In the final claimed compsn. they are covalently connected via disulphide bonds between Cys residues A7/B7 and
                                                                                                                  Gaps
host cells with pBAST-R results in the efficient expression of the proinsulin public projection of the proinsulin projection or the method produces recombinant human insulin identical to the natural hormone. Hazardous and cumbersone procedures involving evanogen bromide and sulphitolysis to protect SH groups are avoided since the entire hybrid polypeptide folds efficiently to the native structure even with the leader attached and Cys improtected.

His method produces pro-insulin with correctly bonded cys bridges. Compared with known methods it involves fewer stages (esp. no sulphitolysis or cyanogen bromide cleavage) and overall losses during purification are reduced, i.e. the process is quicker and gives better yields. Sequences of insulin chain A, B and C are given in AAR68895-97. Sequences of pro-insulin 1-4 are given in AAR68898-901.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     ...----PRFVNQHLCGSHLVEALYLVCGERGFFY; PKTRG

In formula (II), X = Lys, Arg or a peptide of 2-35 amino acids contq. Lys or Arg at the N- and C-termini: Y = a natural amino acid: R1 - Phe or a bond; R2 = H, Arg, Lys, a peptide of 2-45 amino acid: R1 - Phe or a bond; R2 = H, Arg, Lys, a peptide of 2-45 amino acid: R1 - Arg, Arg or Lys at the N- and C-termini: R3 = a natural amino acid: (A2-A20) and (B2-B29) are the insulin A- and B-chain sequences from human or other insulin. The proinsulin A- and B-chain sequences from human or other insulin. The proinsulin molecule (produced in recombinant E.coli) is reacted with mercaptan at a ratio of 2-10 SH reasidues of mercaptan per Cys residue of proinsulin. The reaction takes place in the presence of a chaotropic auxiliary agent at pH 10-11 and results in proinsulin with correctly linked cystine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fro insulin is produced to treating recombinant precursor protein with a mercaptan to pro. .e 2-10 SH residues per Cys residue, in presence of a chaotropic agent and in aq. medium of pH 10-11, creating the prod. with 3-50 g hydrophobic adsorber resin per I aq. medium of pH 4-7, isolating the adsorbed resin and pro-insulin and desorbing the pro-insulin. This method produces pro-insulin with correctly bonded Cys bridges. Compared with Known methods it involves fewer stages (esp. no sulphitolysis or cyanogen bromide the process is quicker and gives better yields.

C the process is quicker and gives better yields.

C sequences of insulin chain A, B and C are given in AAR68895-97.

Sequences of pro-insulin I-4 are given in AAR68898-901.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present sequence is that of a fusion protein, produced in E.coli which contains an example of a proinsulin molecule corresp.

To the general formula R2-R1-(B2-B29)-Y-X-G1y (A2-A20)-R3 (II). In formula (II), X = Lys, Arg or a peptide of 2-35 amino acids contg.

Lys or Arg at the N- and C-termini; Y = a natural amino acid; R1 = C Phe or a bond; R2 = H, Arg, Lys, a peptide of 2-35 amino acid; R1 = C Phe or a bond; R2 = H, Arg, Lys, a peptide of 2-45 amino acid; R1 = C Phe or a bond; R2 = H, Arg, Lys, a peptide of 2-45 amino acid; R1 = C Arg or Lys at the N- and C-termini; R3 = a natural amino acid; (A2-A20) and (B2-B29) are the insulin A- and B-chain sequences contg. Arg or Lys at the N- and C-termini, R3 = a natural amino acid; (A2-A20) and (B2-B29) are the insulin A- and B-chain sequences of acid, (A2-A20) and (B2-B29) are the insulin A- and B-chain sequences of a chaotropic auxiliary agent at residues of mercaptan per Cys residue of proinsulin. The reaction C takes place in the presence of a chaotropic auxiliary agent at phiddes. Reaction with trypsin and opt. carboxypeptidase B yields correctly folded insulin. The insulin is isolated by absortion on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolation of insulin that is correctly post-translationally processed - by reacting pro:insulin with a mercaptan in the presence of a chaotropic agent and purificn. after absorption to hydrophobic
                                                                                                                                                                  post-translational modification; recombinant production;

The insulin precursor comprises the B and A chains of a claimed human insulin derivative preceded by the N-terminal amino acids EEAEAEAR. In the final claimed compentery are covalently connected via disulphide bonds between Cys residues A7/B7 and A20/B19. The derivative, which may be present as a zinc ion complex, can be used as a fast action treatment for
                                                                                                                                                                                                                                             ArgB31; diabetes; Zinc ion complex;

The insulin precursor comprises the B and A chains of a claimed human insulin derivative preceded by the N-terminal amino acids EEAEAEAER. In the final claimed compsn. they are covalently connected via disulphide bonds between Cys residues A7/P3 and A20/B19. The derivative, which may be present as a zinc ion complex, can be used as a fast action treatment for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

A and B chains. This insulin precursor is a component of the chineric proteins insulin precursor is a component of the chineric proteins high-mini-proinsulin (AAY42860) and the chimeric protein diversity and in AAY42861. These chimeric protein additionally contain an N-terminal fragment of human growth hormone (hdh) and a cleavable peptide linker (AAY42857). The hdH portion of the chimeric protein acts as an intranolecular chaperone (IMC) for the insulin precursor.

Combing it to fold correctly. The cleavable peptide linker has a chimeric protein to be removed after folding has taken place. Production of the chimeric protein to be removed after folding has taken place. Production of recombinant human insulin with correctly linked cysteine bridges with fewer necessary procedural steps, and hence resulting in a higher yield for human insulin with correctly linked cysteine bridges with fewer necessary procedural steps, and hence resulting in a higher yield from intracellular degradation by a microordanism host, but also promote the fusion protein and decrease the intermolecular interactions among the fusion proteins, thus allowing folding of the fused insulin precursor, facilitate the solubility of the fusion proteins, thus allowing folding of the fused insulin precursor, the fusion proteins, thus allowing folding of the fused insulin precursor cyanogen bromide cleavage, oxidative sulphitolysis and related purification steps can thus be climinated, along with the use of high concentrations of mercaptan or the use of hydrophobic absorbent resins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a human insulin precursor comprising insulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New chimeric proteins containing human growth hormone fragment, used particularly for the production of human insulin \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    56 FVNQHLCGSHLVEALYLVCGERGFFYTPKTRGIVEQCCTSICSLYQLENYCN 107

This fusion protein may be converted into human insulin using known methods. The synthetic gene was prepared by the phosphoramidite method.
                                                                                                                                                                   /label-Lys residue linking insulin B chain to A chain

Human recombinant insulin may be expressed in Saccharomyces cerevisiae following linkage of the gene to the quycosylphospatidylinositol auchor. This anchoring technique can provide for the release of the product in a highly specific and selective manner. In addition, the recombinant protein will contain an epitope which can be used in its final purification by immunoaffinity. The protein reduced to released by e.g. nitrous (Updated on 25-MAR-2003 to correct PI field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Keller, Reinhold
TITLE OF INVENTION: Improved process for obtaining
insulin precursors having correctly bonded cystine bridges
                                                                                                                                                                                                                                                                                        Sequence 63, Application US/09280030A

Sequence 63, Application US/09280030A

Patent No. US2001002151Sal

GENERAL INFORMATION:

APPLICANT: Sato, Selji

APPLICANT: Higashikuni, Naohiko

APPLICANT: Kudo, Toshiyuki

TITLE OF INVENTION: DNAS ENCODING NEW FUSION PROTEINS AND PROCESSES FOR

TITLE OF INVENTION: DNAS ENCODING NEW FUSION PROTEINS OF THE

TITLE OF INVENTION: DNAS

FILE REFERENCE: 382.1026

CURRENT APPLICATION NUMBER: US/09/280.030A

CURRENT APPLICATION NUMBER: US/09/280.030A

CURRENT PILING DATE: 1999-03-26

EARLIER APPLICATION NUMBER: JP10-8739/1998

EARLIER APPLICATION NUMBER: JP10-8739/1998

METEKARM W., Groneberg J., Leineweber M., Wengenmayer F.,

Winnerder E.L.;

The nucleotide sequence of cDNA coding for preproinsulin from the primate Macaca fascicularis.;

Gene 19:179-183(1982).

INCREASES CELL PERMERBILITY TO MONOSACCHARIDES, AMINO ACIDS AND FATTY ACIDS. IT ACCELERATES GLYCOLYSIS, THE PENTOSE PHOSPHATE CYCLE, AND GLYCOGEN SYNTHESIS IN LIVER.

C.: SUBJUIT: HETERODIMER OF A B CHAIN AND AN A CHAIN LINKED BY TWO DISJUININE BONDS.

INCREASE CELLULAR LOCATION: Secreted.

C.: SUBGELLULAR LOCATION: Secreted.

C.: SIMILARIIY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
